RADIOFREQUENCY - ITS Mobile

It is a browser-based technology that allows any mobile device to connect with SAP and support data capture tasks. It is used in a standard way in the WM module (standard transactions) but it can be used with any SAP ECC module, customizing practically any functionality that our process needs.

Who is it for?
Companies that need to digitize warehouse processes using mobile devices.

What technological solution does it cover?
Building on ITSMobile technology, it gives us the ability to execute SAP transactions directly from a browser on a handheld device and eliminates the need for middleware as the devices connect directly to SAP.
Initially, the radiofrequency is designed to meet the needs of the WM module, in which already developed standard transactions can be used. However, by developing custom applications, the solution becomes very flexible to carry out any operation that is needed.

Advantages
- Possibility of streamlining and automating the handling of information by reading bar codes (movements of pallets, picking, inventories, MM movements between warehouses,...).
- Control of information in real time.
- Great flexibility to develop customized functionalities for processes specific to each business.
- Improved control and productivity of warehouse operations jobs: forklift operators, pickers, loaders...
- Extensive experience of Oreka IT in case studies and solution proposals.
