

DIRECT INVENTORY UPLOAD

Used to speed up the year-end inventory process. In a simple way, from an Excel, the quantities of materials that are counted in the inventory are updated.

Who is it for?

- For companies that carry out inventory at the end of the year and that do so at both MM and WM levels.

Technological solutions

- MM and WM inventory management.

Advantages

- Simplifies the process of loading data into SAP when carrying out the year-end inventory.
- It works with an Excel document, which is used to update data in SAP, as well as a document to follow when counting materials.
- With this solution, it is only necessary to execute one of the three steps to carry out the inventory. SAP already has a tool for mass generation of inventory documents as standard, so it uses SAP standard resources and only uses this program to speed up the rest of the process.
